

Random Geometry MEGL Figures

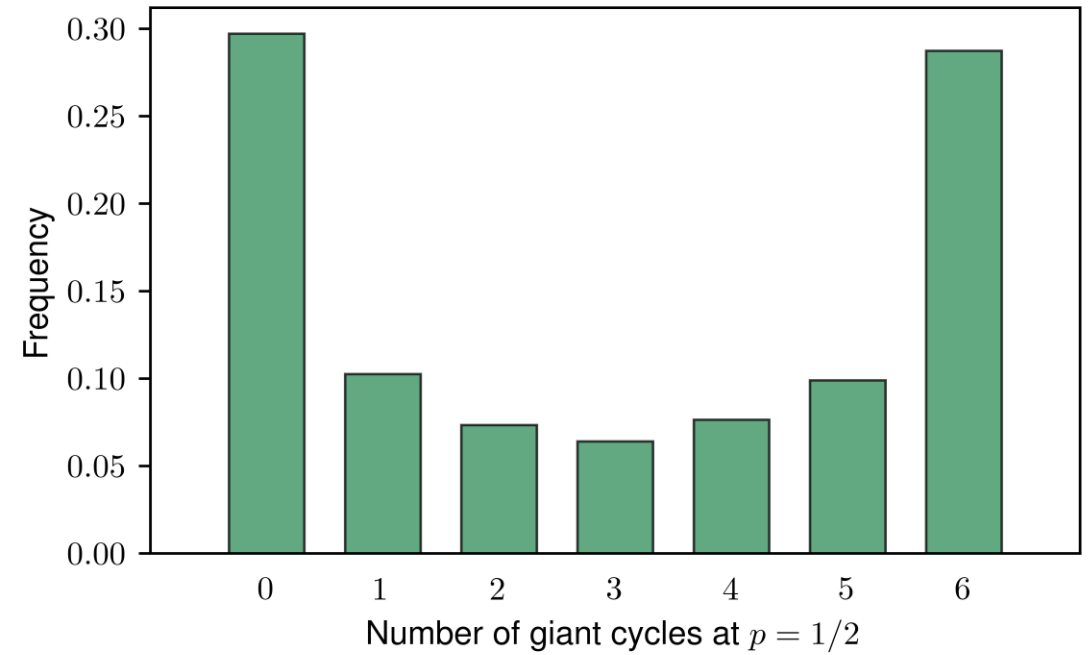

All figures are $d//2$ percolation on 4D

Cubical Figure

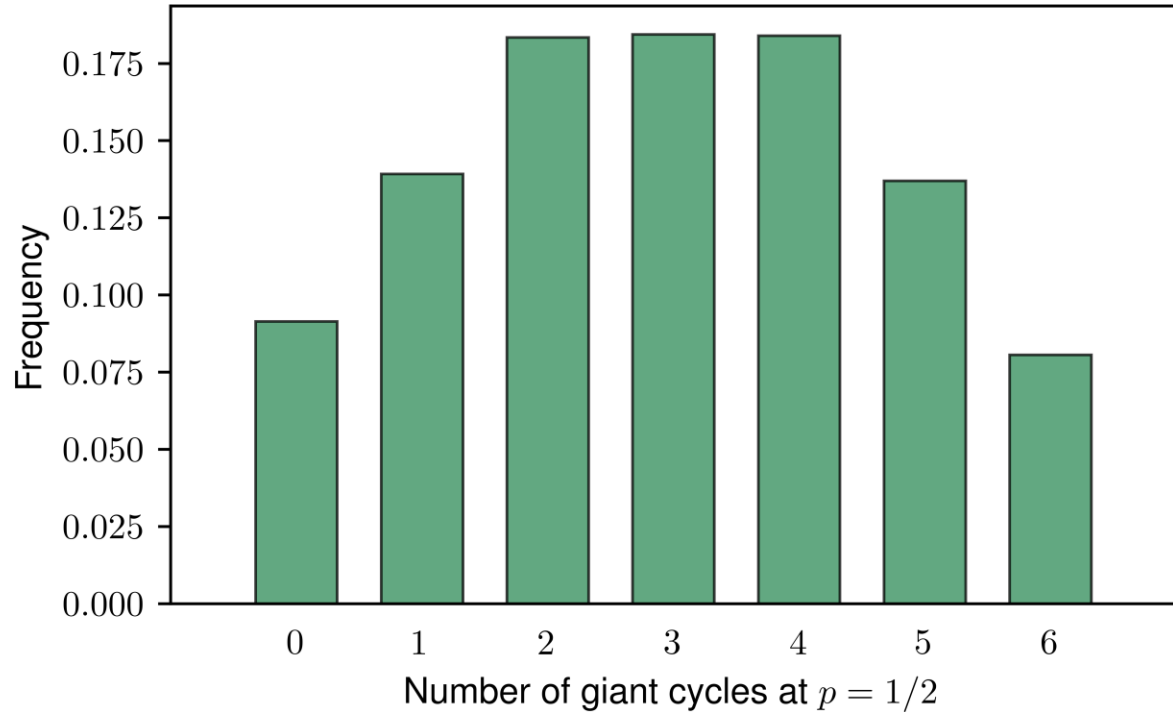

8^4

Bernoulli plaquette (2-cell) percolation
from ATEAMS

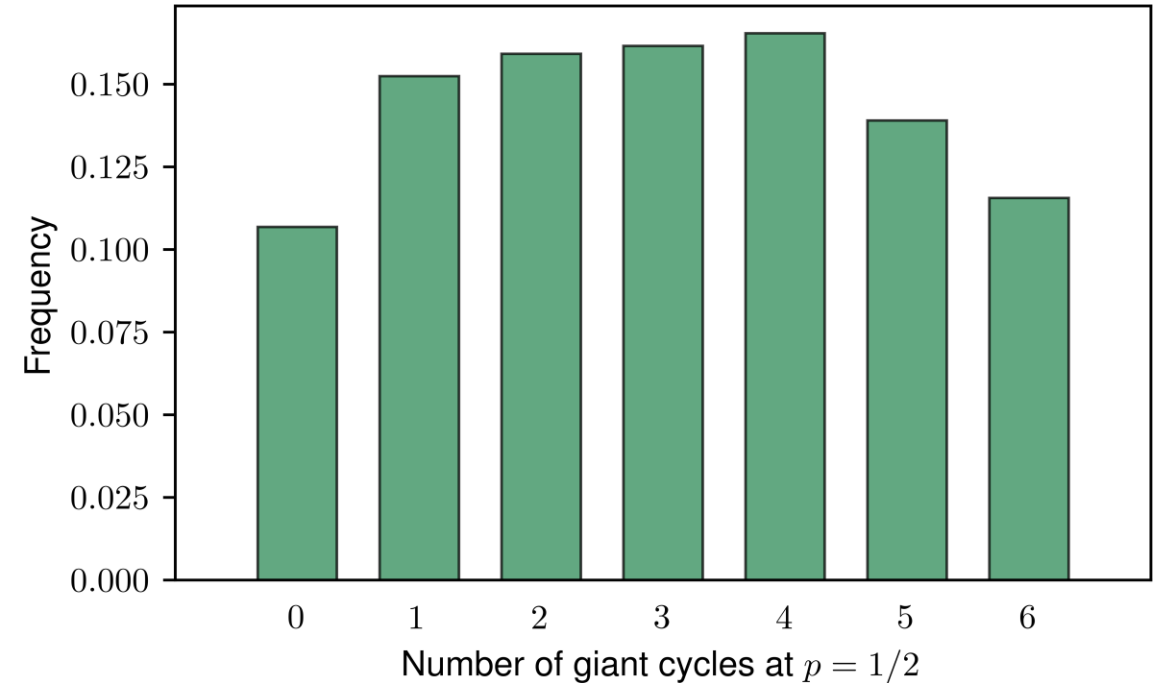

9^4

Permutohedra Figures (Square)

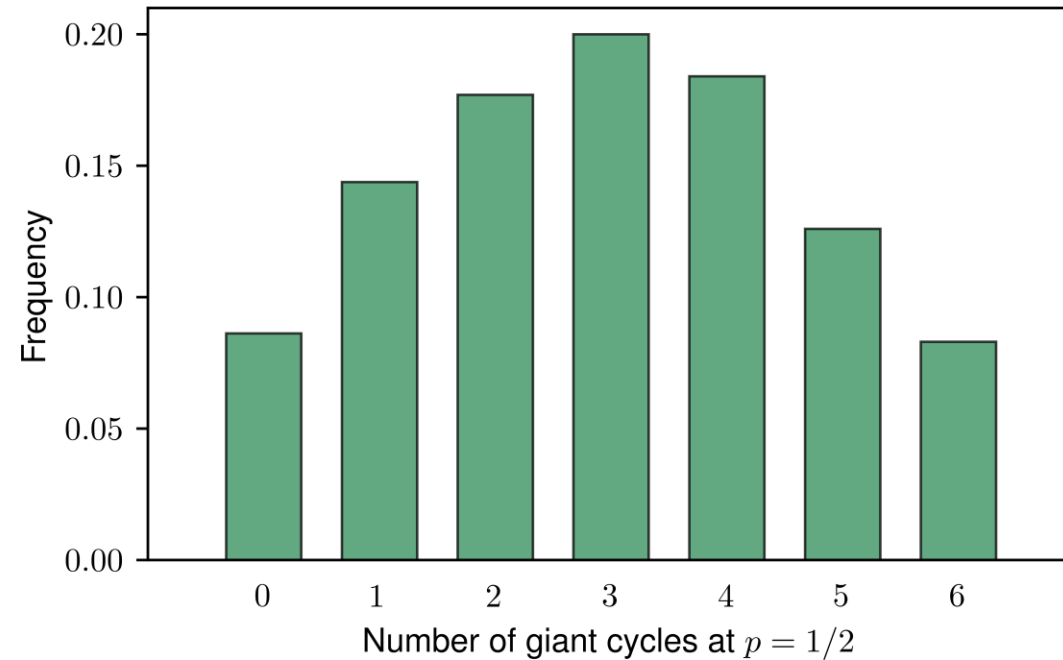

6^4

Bernoulli site percolation on the simplicial dual (Delaunay complex) of the permutohedral lattice. Hexagons are oriented in square shape, so they are oscillating up and down to be flat.

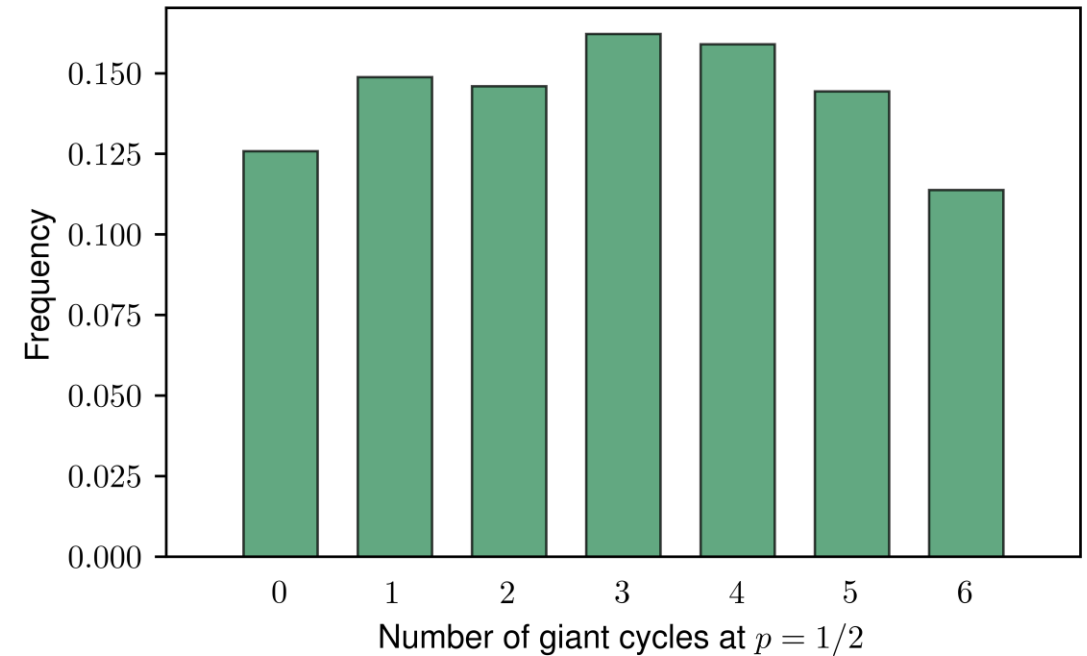

9^4

Permutohedra Figures (Rhombic)

6^4

9^4

Bernoulli site percolation on the simplicial dual (Delaunay complex) of the permutohedral lattice. Hexagons are oriented in rhombic shape, so not oscillating

Summary/Conclusion

- We can see the bimodal distribution of the cubical lattice, as already observed previously
- Looking at the Permutohedra, we can see the inverse unimodal distribution, similar in shape to a binomial distribution.
